

I am very excited to welcome you all to Surfing the Semiosphere, Ecology of Senses, and look forward to working together in Kilpisjärvi.

To make the most of our time together, pleasurable and productive, we need to develop a plan together prior to the fieldweek. Here and now is where we will start.

- It would be great if you could all introduce yourself briefly, what your particular interest is in the theme of our group, your expectations and any initial ideas you may have.
- The general goal of the workweek is to do (outdoor:) fieldwork, exploring, investigating, inventorying meaningful interrelationships in the surroundings of the biological fieldstation, based on biosemiotic principles. The general goal of the preparatory time will be to think about and outline specific field week goals and what would be ideal, practical, and feasible to bring to Kilpisjärvi in terms of equipment. What do we collectively already have, what can we otherwise arrange.
- In addition to our fieldwork, I also suggest we reserve some time for brainstorming and discussion during the fieldweek, to contextualize our fieldwork and so contribute to the larger goals of Biosemiotics, doing a different kind of research and reimagining our worlds in radical new ways. In the coming week I will provide some literature/background to get us started. Any, thoughts, contributions regarding field methods, sensors, Arctic environment or any other topic you think relevant is most welcome.

I am working both as an independent artist, and academic researcher in London. I have been making work in and around various issues relating to science for around 20 years and spent a great deal of this recent period developing fieldwork and field experiments as artworks, with Office of Experiments, which I founded in 2004. Office of Experiments is a network of researchers who work independently of academic research on projects of shared interest, often without a disciplinary bias. Our current research focuses on 'The Deep Field', a term for addressing artist work out in the field, in which we are very interested. Our website is currently being updated, but more information will be there soon. Aside from that I co-direct a research centre called CREAM at University of Westminster, which is also very interesting.

Before I start delving deeper, I look forward to learn a little more about the 'biosemiotics principles', that I hope will inform my own suggestions for fieldwork experiments. As I am interested in the concept and process of the experimental, including experimental systems (Rheinberger) I need to do this groundwork with these ideas to work out what might be of value to the group, before I suggest anything back to the group. So any further information- authors, artists, talks etc., are my starting point. I look forward to hearing more.

if this helps, I have looked recently at making 'material' or visible in situ, data, using a simple light painting / photographic approach, using seismic data feeds taken from a global sensor array. But I am also interested in the contrast between these high tech and remote human sensors, and the relationship to non-human actors- particularly as they are read with situated knowledge of a place. It is the contrast between what has been called the 'technosphere' and more socially/locally informed readings of nature

that work closely with non-human actors around which I think I would like to explore further with others. Scale also interests me, as does the concept of an 'event' structure, a term for a kind of 'time based work' around which much of my work is based. This comes from the work of the late John Latham, a British artist I was in dialogue with.

So, I look forward to sharing with you as much as possible ideas and plans on what I hope to be a very engaging field lab.

With best wishes from the descending chaos of the UK!

Neal
